- Module description

Introduction

The Module handbook provides detailed information regarding the course content and curriculum of the Master's Program 'Computational Engineering'.

1. Modularization (Modularisierungskonzept)

- The course curriculum has a modular structure. It consists of compulsory modules, elective modules and optional modules.
- Credit points (CP) according to the European Credit Transfer System (ECTS) are awarded for the successful completion of each module. One CP according to the ECTS corresponds to an average student workload of 30 hours. The number of credit points awarded for a certain module depends on the workload (see module description of the lecture for further details).

2. Curriculum (Studienplan)

- The Master's program has a duration of 4 semesters. The compulsory courses in the first semester build a core set of skills in Numerical Mathematics, Computational Mechanics, Computer Science and other relevant courses. The specialization phase in the second and third semesters is flexible and allows students to focus on the different lines of Computational Engineering by choosing courses of their own choice from the course catalogue. In the fourth semester, students prepare their master's thesis in a research field that is relevant for computational engineering. In total, 120 CP according to the ECTS are required for the successful completion of the Master's program. The complete course catalogue is provided below.

3. Types of examinations (Prüfungsform) and examination regulations (Prüfungsordnung)

- With the exception of the Master's thesis, examinations are module examinations, either graded or ungraded (see module descriptions for further details). They may be conducted in the form of a written examination, an oral examination, by working on tasks during the course, a project, a seminar paper, a report or a colloquium presentation. Please refer to the examination regulations (Prüfungsordnung) for further details.

4. Grading of the master's examinations

- The overall grade (avg) of the master's examination arises as a weighted arithmetic mean (weighted with the CPs) of all graded module examinations with the exception of the optional modules. When calculating the overall grade, the grades for the compulsory modules with a factor of 1, the grades for the compulsory optional modules with a factor of 1.5, and the grade for the master's thesis with a factor of 2.0 are weighted in addition. Decimal values are to one decimal place.

5. Counseling (Beratung)

- The CompEng Coordination Office is maintained by the Faculty of Civil and Environmental Engineering. Its members offer counseling on study related matters to students of the Master's program. In addition, the lecturers of the Master's program provide consultation hours, during which students may clarify questions concerning the respective course.

Changes in the summer semester 2025

Module number	Module Title	Module coordinator and lecturer(s)	Change
CE-WP04	Nonlinear Finite Element Methods for Structures	Sauer	New title Old Title: Advanced Finite Element Methods
CE-WP06	Inelastic Finite Element Method for Structures	Sauer, Gudžulić	New title Old Title: Finite Element Methods for Nonlinear Analyses of Materials and Structures
CE-WP09	Numerical Simulation in Geotechnics and Tunneling	Wichtmann, Schmüdderich	Both parts will now be offered by the Chair of Soil Mechanics, Foundation Engineering and Environmental Geotechnics (Prof. Wichtmann)
CE-WP29	Uncertainty Quantifications in FE Analyses with Surrogate Modelling	Cao, Neu	New Module
CE-WP30	Transient Finite Element and Finite Differences Methods	Sauer, Butt	New Module
CE-WP31	Scientific C++ Programming (Basics)	Vogel	Now offered as an compulsory optional course. Old module number CE-W09
CE-WP32	Scientific C++ Programming (Advanced)	Vogel	Now offered as an compulsory optional course. Old module number CE-W10; Offered in the summer semester 2025 during the semester, not as a block course.
CE-WP33	Deep Learning for Engineers	Vogel	New Module
CE-WP34	Advanced Discretization Methods	Vogel	New Module
CE-W06	Advanced Constitutive Models for Geomaterials	Wichtmann, Schmüdderich	New content, previous components of the Chair of Structural Mechanics (Prof. Sauer) not included, now completely offered by the Chair of Soil Mechanics, Foundation Engineering and Environmental

			Geotechnics (Prof. Wichtmann), 3 CP -> 6CP
CE-W07	Project Management for Engineers	Cavara	is no longer offered

Adaptronics					
Adaptronics					
Module number CE-WP03/ ADAP	Credits 5 CP	Workload 150 h	Semester[s] 2. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Adaptronics			Contact hours a) 3 WLH (45 h)	Self-study a) 105 h	Frequency a) each summer
Module coordinator and lecturer(s) Prof. Dr. Tamara Nestorovic a) Prof. Dr. Tamara Nestorovic					
Admission requirements Recommended previous knowledge: Basic knowledge in Structural Mechanics, Control Theory and Active Mechanical Structures is of advantage. (Englischer Test)					
Learning outcome, core skills Acquiring knowledge in fundamental control methods, structural mechanics and modeling and their application to the active control of mechanical structures. After successfully completing the module, the students <ul style="list-style-type: none"> • have basic knowledge in behavior and modeling of piezoelectric materials for adaptronic structures and systems, • have knowledge in model development of mechanical structures for the control system design (linear time invariant systems in state space and transfer function form), • are able to perform the model based system analysis in time and frequency domain, • are able to design basic control structures with compensator and feedback gain systems, • are able to independently simulate control systems (PID and pole placement controller), • have knowledge in discrete-time control systems, • are able to use Matlab/Simulink software and Toolboxes for the control system analysis, design and simulation. 					
Contents a) An overall insight of the modeling and control of active structures is given within the course. The terms and definitions as well as potential fields of application are introduced. For the purpose of the controller design for active structural control, the basics of the control theory are introduced: development of linear time invariant models, representation of linear differential equations systems in the state-space form, controllability, observability and stability conditions of control systems. The parallel description of the modeling methods in structural mechanics enables the students to understand the application of control approaches. For actuation/sensing purposes multifunctional active materials (piezo ceramics) are introduced as well as the basics of the numerical model development for structures with active materials. Control methods include time-continuous and discrete-time controllers in the state space for multiple-input multiple-output systems, as well as					

methods of the classical control theory for single-input single output systems. Differences and analogies between continuous and discrete time control systems are specified and highlighted on the basis of a pole placement method. Closed-loop controller design for active structures is explained. Different application examples and problem solutions show the feasibility and importance of the control methods for structural development. Within this course the students learn computer aided controller design and simulation using Matlab/Simulink software. Students will implement the acquired knowledge in the framework of a seminar paper related to the controller design supported by Matlab Software.

Educational form / Language

a) Lecture with tutorial / Tutorial / English

Examination methods

- Term paper 'Adaptronics - Seminar paper' (30 h., Part of modul grade 0 %, Deadlines will be announced at the beginning of the semester)
- Written exam 'Adaptronics' (90 min., Part of modul grade 100 %)

Requirements for the award of credit points

- Passed final module examination
- Passed Seminar paper

Module applicability

- M.Sc. Computational Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $5 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

After successfully completing the module, the students are able to					
<ul style="list-style-type: none"> • model the material behavior of soil using suitable, advanced constitutive models, • select suitable numerical methods and constitutive models for practical questions and assess limitations according to the selected approaches, • calibrate the parameters of the advanced constitutive models and evaluate the model performance based on single integration point simulations 					
Contents					
a)					
The course deals with the introduction of advanced soil mechanical behavior and appropriate constitutive models allowing to capture advanced effects. Model formulations and parameter calibration for different soil model families are taught. In addition, an introduction to single integration point finite element simulations with Incremental Driver (ID) is provided and simulations of different laboratory tests are conducted with ID using different elasto-plastic and hypoplastic constitutive models.					
Advanced soil mechanics:					
<ul style="list-style-type: none"> • Critical state soil mechanics • Crushable soil mechanics • Unsaturated soil mechanics • Soil memory effects and their modelling • Clay structure and small-strain stiffness anisotropy • Influence of temperature on soil behavior and its modelling 					
Sophisticated constitutive models for soils:					
<ul style="list-style-type: none"> • Modified Cam-Clay model • Sanisand • Hypoplasticity with Intergranular Strain • Clay Hypoplasticity • Hypoplasticity for crushable soils • Visco-hypoplasticity 					

<ul style="list-style-type: none">• Barcelona Basic Model

Courses a) Advanced Control Methods for Adaptive Mechanical Systems			Contact hours a) 4 WLH (60 h)	Self-study a) 0 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. Tamara Nestorovic a) Prof. Dr. Tamara Nestorovic					
Admission requirements Recommended previous knowledge: Adaptronics (CE-WP03), fundamentals of control theory and structural control.					
Learning outcome, core skills Extended knowledge in adaptive mechanical systems, advanced control methods and their application for the active control of structures. After successfully completing the module, the students <ul style="list-style-type: none"> • have advanced knowledge in control systems design, • are able to design full order observer of the states in a state space model, • have basic knowledge in observation using Kalman filter, • have basic knowledge in the system identification of state-space models, • have knowledge in experimental modal analysis, • are able to independently design a velocity feedback vibration suppression for basic mechanical structures. 					
Contents a) Advanced methods for the control of adaptive mechanical systems are introduced in the course. This involves the recapitulation of the fundamentals of active structural control and an extension to advanced control. Observer design is introduced as a tool for the estimation of system states. In addition to numerical modelling using the finite element approach, system identification is explained as an experimental approach. Theoretical backgrounds of the experimental structural modal analysis are introduced along with the terms and definitions used in signal processing. Experimental modal analysis is explained using the Fast Fourier Transform. Advanced closed loop control methods involving optimal discrete-time control, introduction of additional dynamic approaches for the compensation of periodic excitations and basic adaptive control algorithms are explained and pragmatically applied for solving problems of vibration suppression in civil and mechanical engineering.					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English					
Examination methods					

- Written exam 'Advanced Control Methods for Adaptive Mechanical Systems - Written examination' (120 min., Part of modul grade 100 %)

Admission requirements					
Learning outcome, core skills After successfully completing the module, the students <ul style="list-style-type: none"> • have acquired a solid foundation in the mathematical formulations, implementation aspects and application of advanced discretization methods for the solution of partial differential equations, such as the finite cell method (FCM) and isogeometric analysis (IGA), • understand the advantages and disadvantages of each method and can independently evaluate their suitability for a given situation, • can apply their knowledge to the solution of various engineering and scientific problems. 					
Contents a) The lecture covers advanced discretization techniques beyond the conventional finite element methods for the solution of partial differential equations, such as the finite cell method (FCM) and isogeometric analysis (IGA). In each case the mathematical formulation as well as the implementation aspects of the method are discussed and contrasted with conventional methods. Furthermore, the strengths and shortcomings of each method are highlighted such that their suitability for a given problem can be evaluated.

Admission requirements					
Learning outcome, core skills After completion of the project work, the students <ul style="list-style-type: none"> • will have gained experience in working on a problem individually or in small groups, • are able to organize and coordinate the assignment of tasks independently under the supervision of an advisor, • should have gathered new information and insights into the activities of practicing engineers while acquiring skills in innovative research fields, • will be able to present technical projects, and to develop problem solution strategies, hence obtaining worthwhile communication skills. 					
Contents a) The project topic is usually determined by the respective lecturer or one of his/her assistants. In addition to this, students may also conduct project work on topics defined by companies from industry or official authorities. However, the project work must be completed under the supervision of one of the course's lecturers. The projects are usually devised so as to integrate interdisciplinary aspects such as <ul style="list-style-type: none"> • Noticing problems and describing them • Formulating envisaged goals • Team-oriented problem solutions • Organizing and optimizing one's time and work plan • Interdisciplinary problem solutions • Literature research and evaluation as well as the consultation of experts • Documentation, illustration and presentation of results The topic of a project paper is devised by a lecturer of the course or an assistant who supervises the exercises. The student - or a small group of students - conducts a project independently and presents the results in the form of a written report and optionally, an oral presentation (upon agreement with the respective lecturer).					
Educational form / Language a) Project / English					
Examination methods					

- Term paper 'Hausarbeit' (<Ohne>, Part of modul grade 100 %, The project paper and presentation will be graded. For this purpose, the individual achievements of the students within the project groups are separately evaluated. The evaluation includes: Written project paper / 75% (100% without a final presentation) Final presentation / 25% (optional))
- Independent work in seminar rooms and computer labs; testing plants, where applicable.

Requirements for the award of credit points

Module applicability

- M.Sc. Computational Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $3 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Computational Wind Engineering					
Computational Wind Engineering					
Module number CE-WP14/CWE	Credits 3 CP	Workload 90 h	Semester[s] 3. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Computational Wind Engineering			Contact hours a) 2 WLH (30 h)	Self-study a) 60 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr.-Ing. Rüdiger Höffer a) Prof. Dr.-Ing. Rüdiger Höffer, Dipl.-Ing. Ulf Winkelmann					
Admission requirements Recommended previous knowledge: Modern Programming Concepts in Engineering (CE-P04), Fluid Dynamics (CE-P06), Recommended: Computational Fluid Dynamics (CE-WP05)					
Learning outcome, core skills The students acquire advanced skills of CFD methods for the computation of wind engineering problems such as <ul style="list-style-type: none"> • mean wind parameters and turbulence characteristics for the assessment of local wind climates (incl. wind farm locations), • wind pressures at surfaces for the determination of wind loads at structures, • gaseous transport in the atmospheric boundary layer for the prediction of the dispersion of exhausts and particles. After successfully completing the module, the students will be able to <ul style="list-style-type: none"> • understand the broad scope of computational fluid dynamics and the thematic integration of computational wind engineering within, • identify fluid dynamical mechanisms of observed flow phenomena and choose adequate and suitable CFD methods to explore and formulate engineering solutions for real flows, • solve relevant technical problems in the field of computational wind engineering by means of applying CFD simulations, • validate, verify, and assess the solutions and results of CFD simulations, • transfer learned skills in media literacy, and digital competence through the completion of supervised and supported self-studies to other engineering activities. 					
Contents a) This course introduces the details and guidelines for the application of CFD methods in the field of wind engineering. Relevant problems for practical applications and solution procedures are investigated. The theoretical background is taught in the obligatory Fluid Dynamics course while this course aims at the practical application of CFD methods on various wind engineering problems. In general, the steady state RANS approach and the time dependent LES approach are used. The lectures and exercises include all necessary steps of a CFD simulation ranging from the creation of the geometry of the problem to the assessment and presentation of the results. During the semester, the commercial software package ANSYS CFX and the open source software OpenFOAM are used.					

The following working steps are explained and carried out:

- Generation of simple geometries and block structured grids and analysis of the influence of the quality of the mesh on the results of the simulation.
- Generation of complex geometries and unstructured numerical grids.
- Setting up simulations (Pre-Processing):
 - Choosing the right boundary conditions.
 - Choosing the correct turbulence models.
 - Deciding on the parameters of the finite volume method such as interpolation schemes for the convective term of the Navier-Stokes equation.
 - Adding source terms of exhaust for the investigation of pollution in the atmosphere.

Computer-based Analyses of Steel Structures					
Computer-based Analyses of Steel Structures					
Module number CE-PO3/CbASS	Credits 6 CP	Workload 180 h	Semester[s] 1. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Computer-based Analyses of Steel Structures			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Vertr.-Prof.'in Dr.-Ing. Rebekka Winkler a) Vertr.-Prof.'in Dr.-Ing. Rebekka Winkler					
Admission requirements Recommended previous knowledge: Fundamental knowledge in mechanics and strength of materials					
Learning outcome, core skills This course will introduce students to the fundamental structural behaviour of steel structures, numerical solution procedures and modelling details. The course aims to achieve a basic understanding of applied mechanics approaches to modelling member behaviour in steel structure problems. The course is addressed to young engineers, who will face the necessity of numerical analysis and applied mechanics more often in their design practice. The purpose of this course is to bridge the gap between applied mechanics and structural steel design using state-of-the-art tools. The students shall become familiar with computer-oriented analyses and design methods by using the example of steel constructions. The course will also convey to students the ability to use numerical tools and software packages for the solution of practical problems in engineering. After successfully completing the module, the students <ul style="list-style-type: none"> • have fundamental knowledge on structural and fatigue behavior of steel structures with the application of numerical procedures and modeling, • should be familiarized with basic principles of design and computer-oriented procedures in assessing steel structures, their stability behavior and durability, • will have gained experience in undertaking new concepts on their own and participate in inclass collaborative learning through the Inverted-classroom format, • will have gained skills in working on a problem individually and in groups, presenting their findings in interactive presentations as well as assessing the findings of their peers. 					
Contents a) This course is introductory – by no means does it claim completeness in such a dynamically developing field as numerical analysis of slender steel structures. The course intends to achieve a basic understanding of applied mechanics approaches to slender steel structure modelling, which can serve as a foundation for the exploration of more advanced theories and analyses of different kind of structures. <i>Basics of the Analysis, Design and Fundamentals for Computer-Based Calculations</i> <ul style="list-style-type: none"> • Basic principles of structural design • Beam theory and torsion • Finite elements for beams and plates 					

- Software for analyses

Stability Behaviour of Slender Structures and Second Order Theory

- Geometric non-linear design of structures second order analysis
- Buckling of linear members and frames
- Lateral buckling and lateral torsional buckling
- Eigenvalues and –shapes
- Numerical methods for plate buckling

Structural Durability

- Fatigue
- Modern Concepts of Fatigue Strength Design
- Local Strain Concept
- Crack Propagation Concept

Educational form / Language

a) Tutorial (2 WLH) / Lecture (2 WLH) / English

Examination methods

- Written exam 'Klausur' (180 min., Part of modul grade 100 %)

Requirements for the award of credit points

- Passed final module examination

Module applicability

- M.Sc. Computational Engineering

Fluid Dynamics					
Module number CE-P06/FD	Credits 3 CP	Workload 90 h	Semester[s] 2. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Fluid Dynamics			Contact hours a) 2 WLH (30 h)	Self-study a) 60 h	Frequency a) each summer
Module coordinator and lecturer(s) Prof. Dr.-Ing. Rüdiger Höffer a) Prof. Dr.-Ing. Rüdiger Höffer					
Admission requirements Recommended previous knowledge: Mathematical Aspects of Differential Equations and Numerical Methods (CE-P01), Mechanical Modeling of Materials (CE-P02), Fluid Mechanics (Bachelor level)					
Learning outcome, core skills The students shall acquire consolidated skills of the basic laws of hydraulics, potential theory, flow dynamics and turbulence theory. The students shall be enabled to assess and to solve technical problems related to flow dynamics in hydraulics and in aerodynamics. After successfully completing the module, the students will be able to <ul style="list-style-type: none"> • understand the broad scope of fluid dynamics and the thematic integration of computational fluid dynamics within, • identify fluid dynamical mechanisms of observed flow phenomena and recognize the governing physical laws, • choose and apply adequate engineering models to explore and formulate engineering solutions for real flows, • solve fluid dynamical problems of acceptable complexity tailored to the student's study status, • validate and assess these solutions and the achieved results, • acquire skills in numeracy, media literacy, and digital competence through the completion of supervised and supported self-studies and other activities. 					
Contents a) The technical basics of dynamic fluid flows are introduced, studied and recapitulated as well as related problems which are relevant for practical applications and solution procedures with an emphasis put on computational aspects. The lectures and exercises contain the following topics: Short review of hydrostatics and dynamics of incompressible flows involving friction (conservation of mass, energy and momentum, Navier-Stokes equations) Potential flow Isotropic turbulence and turbulence in a boundary layer flow Flow over streamlined and bluff bodies The students are guided in the exercises to working out assessment and solution strategies for related, typical technical problems in fluid dynamics.					

Educational form / Language
a) Tutorial (1 WLH) / Lecture (1 WLH) / English
Examination methods
• Written exam 'Klausur' (75 min., Part of modul grade 100 %)
Requirements for the award of credit points
• Passed final module examination
Module applicability
• M.Sc. Computational Engineering
Weight of the mark for the final score
Percentage of total grade [%] = $3 * 100 * \text{FAK} / \text{DIV}$ FAK: The weighting factors can be taken from the table of contents. DIV: The values can be taken from the table of contents.

High-Performance Computing on Clusters					
Module number CE-WP26/ HPCC	Credits 6 CP	Workload 180 h	Semester[s] 3. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) High-Performance Computing on Clusters			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. Andreas Vogel a) Prof. Dr. Andreas Vogel					
Admission requirements					
Learning outcome, core skills After successfully completing the module, the students <ul style="list-style-type: none"> • are enabled to design and create programs for parallel computing clusters, • can critically evaluate distributed-memory systems and programming patterns, • can assess the mathematical properties of iterative solvers and their scalability. 					
Contents a) The lecture deals with the parallelization on cluster computers. Distributed-memory programming concepts (MPI) are introduced and best-practice implementation is presented based on applications from scientific computing including the finite element method and machine learning. Special attention is paid to scalable solvers for systems of equations on distributed-memory systems, focusing on iterative schemes such as simple splitting methods (Richardson, Jacobi, Gauß-Seidel, SOR), Krylov-methods (Gradient descent, CG, BiCGStab) and, in particular, the multigrid method. The mathematical foundations for iterative solvers are reviewed, suitable object-oriented interface structures are developed and an implementation of these solvers for modern parallel computer architectures is developed. Numerical experiments and self-developed software implementations are used to discuss and illustrate the theoretical results.					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English

Inelastic Finite Element Methods for Structures					
Inelastic Finite Element Methods for Structures					
Module number BI-WP59/CE-WP06/SE-CO-20	Credits 6 CP	Workload 180 h	Semester[s] 2. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Inelastic Finite Element Methods for Structures			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. Roger A. Sauer a) Dr.-Ing. Vladislav Gudzulic, Prof. Dr. Roger A. Sauer					
Admission requirements Recommended previous knowledge: Basic knowledge of tensor analysis, continuum mechanics and linear Finite Element Methods. Previous participation in the course Nonlinear Finite Element Method for Structures is recommended and participation Object-Oriented Modeling and Implementation of Structural Analysis Software is advantageous.					
Learning outcome, core skills After successfully completing the module the students will <ul style="list-style-type: none"> • understand the fundamentals of dissipative processes in the context of modeling inelasticity in quasi-brittle materials, using concrete as the main example. • learn the computational approaches for modeling elastoplastic, damage and friction behavior. • be familiar with the concept of strain localization and localized failure, including their mathematical and numerical implications, as well as strategies to address them. • gain practical experience with implementation and algorithmic treatment of inelasticity in the context of incremental-iterative nonlinear structural analysis. • develop skills to select appropriate numerical methods and material models, including multi-scale approaches, for practical problems and critically assess their limitations. • be able to perform incremental analyses of progressive structural failure, critically evaluate the results, and assess the key design parameters such as load and deformation at the onset of inelasticity and structural redundancy (plastic reserve/residual strength). 					
Contents a) The course is concerned with inelastic material models including their algorithmic formulation and implementation in the framework of nonlinear finite element method. Strain localization and localized failure will be explored in detail, focusing on their mathematical and numerical implications, as well as the strategies to address them. Further, the course covers the fundamental theory and implementation aspects of frictional contact. Special attention will be given to efficient algorithms for physically nonlinear structural analyses, including elastoplastic and damage models for quasi-brittle materials, as well as friction algorithms. While concrete serves as a primary example, these modeling approaches are equally applicable to other materials such as rocks, fiber composites, sea ice, bone, stiff soils, and wood. The course includes					

coding exercises and a final assignment, where students implement a selected inelastic model into a finite element program and apply it to nonlinear structural analysis.

Educational form / Language

a) Lecture with tutorial / English

Examination methods

• Term paper 'Inelastic Finite Element Methods for Structures' (90 h., Part of modul grade 100 %, Project work (implementation of an inelastic model into FE code) with final student presentation / bonus points for homework assignments)

Requirements for the award of credit points

- Passed final module examination

Module applicability

- M.Sc. Civil Engineering
- M.Sc. Computational Engineering
- M.Sc. Subsurface Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Admission requirements Recommended previous knowledge: The course requires basic mathematical tools from linear algebra, calculus, and probability theory. More advanced mathematical material will be introduced as needed. The practical sessions involve programming exercises in Python. Participants need basic programming experience. They are expected to bring their own devices (laptops).					
Learning outcome, core skills The participants understand statistical learning theory. They have basic experience with machine learning software, and they know how to work with data for supervised learning. They are able to apply this knowledge to new problems and data sets. After successfully completing the module, the students <ul style="list-style-type: none"> • understand the basics of statistical learning theory, • know the most relevant algorithms of supervised machine learning, and are able to apply them to learning problems, • know and understand the strengths and limitations of various learning models and algorithms, • can apply standard machine learning software for solving learning problems. 					
Contents a) The field of machine learning constitutes a modern approach to artificial intelligence. It is situated in between computer science, neuroscience, statistics, and robotics, with applications ranging all over science and engineering, medicine, economics, etc. Machine learning algorithms automate the process of learning, thus allowing prediction and decision making machines to improve with experience. This lecture will cover a contemporary spectrum of supervised learning methods. All lecture material will be in English. The course will use the flipped classroom concept. Students work through the relevant lecture material at home. The material is then consolidated in a 4 hours/week practical session.					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English					
Examination methods • Written exam 'Written examination' (90 min., Part of modul grade 100 %)

Further Information

The course applies a flipped classroom format. The sessions plan is largely based on the following caltech lectures: <http://work.caltech.edu/telecourse.html>

Master Thesis Masterarbeit CE					
Module number CE-M	Credits 30 CP	Workload 900 h	Semester[s] 4. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Master's Thesis			Contact hours	Self-study a) 900 h	Frequency a) each sem.
Module coordinator and lecturer(s) Alle Professorinnen und Professoren des Studiengangs a)					
Admission requirements Students can start their Master's thesis if six from seven compulsory courses have successfully been completed and a minimum of 70 credits has been collected.					
Learning outcome, core skills With the completion of the Master's thesis, <ul style="list-style-type: none"> • the students acquire the ability to plan, organize, develop, operate and present complex problems in Computational Engineering, • qualifies students are qualified to work independently in the field of Computational Engineering under the supervision of an advisor, • the associated presentation serves to promote the students' ability to deal with subject-specific problems and to present them in an appropriate and comprehensible manner, Further, it serves to prove whether the students have acquired the profound specialised knowledge, which is required to take the step from their studies to professional life, whether they have developed the ability to deal with problems from their in-depth subject by applying scientific methods, and to apply their scientific knowledge.					
Contents a) The Master's thesis can either be theoretically-, practically-, constructively- or organisationally oriented. Its topic is determined by the respective supervisor. The results should both be visualised and illustrated in writing in a detailed manner. This particularly includes a summary, an outline and a list of the references used within a specific thesis and obligatorily, an oral presentation.					
Educational form / Language a) Final thesis / English / German					
Examination methods • Final thesis 'Masterarbeit' (6 mth., Part of modul grade 100 %, Review of the Master thesis report and oral presentation)					
Requirements for the award of credit points Successful evaluation (grade not lower than 4.0) of Master's thesis and oral presentation					
Module applicability <ul style="list-style-type: none"> • M.Sc. Computational Engineering 					
Weight of the mark for the final score					

Percentage of total grade [%] = $30 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Further Information

Independent work in seminar rooms and computer labs; testing plants, where applicable. The topic of the Master's thesis is issued by a lecturer of the course. The student conducts research independently and presents the results in the form of a final written report and an oral presentation / English or German

Materials for Aerospace Applications					
Materials for Aerospace Applications					
Module number CE-WP20/MAA	Credits 6 CP	Workload 180 h	Semester[s] 3. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Materials for Aerospace Applications			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. rer. nat. K. Hackl a) Prof. Dr.-Ing. Marion Bartsch, Prof. Dr. rer. nat. Klaus Hackl					
Admission requirements					
Learning outcome, core skills After successful completion of the module, students can <ul style="list-style-type: none"> • recapitulate which high performance material systems are used for aerospace applications, how they are manufactured, and which microscopic mechanisms control their properties, • explain and apply procedures for selecting and developing material systems for aerospace components, considering the specific requirements, • decide which characterization and test methods to apply for qualifying materials and joints for aerospace applications and know how lifetime assessment concepts work, • communicate, using technical terms in the field of aerospace engineering in English. 					
Contents a) The substantial requirements on materials for aerospace applications are „light and reliable“, which have to be fulfilled in most cases under extreme service conditions. Therefore, specifically designed materials and material systems are in use. Furthermore, joining technologies play an important role for the weight reduction and reliability of the components. Manufacturing technologies and characterization methods for qualifying materials and joints for aerospace applications will be discussed. Topics are: <ul style="list-style-type: none"> • Loading conditions for components of air- and spacecrafts (structures and engines) • Selecting and developing materials and material systems for service conditions in aerospace applications (e.g. for aero-engines, rocket engines, thermal protection shields for reentry vehicles, light weight structures for airframes, wings, and satellites) • Degradation and damage mechanisms of aerospace material systems under service conditions • Characterization and testing methods for materials and joints for aerospace applications • Concepts and methods for lifetime assessment 					
Educational form / Language a) Tutorial (1 WLH) / Lecture (3 WLH) / English					
Examination methods • Written exam 'Written examination' (120 min., Part of modul grade 100 %, exceptions approved by examination office: oral exam/ 30 min)					

Requirements for the award of credit points

- Passed final module examination

Module applicability

- M.Sc. Computational Engineering
- M.Sc. Mechanical Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Further Information

- Recommended are basics in materials science and solid mechanics
- Script in English, additional literature announced during lecture

Mathematical Aspects of Differential Equations and Numerical Mathematics					
Mathematical Aspects of Differential Equations and Numerical Mathematics					
Module number CE-P01/SE-C-1/MADENM	Credits 6 CP	Workload 180 h	Semester[s] 1. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Mathematical Aspects of Differential Equations and Numerical Mathematics			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. Barney Bramham a) Prof. Dr. Barney Bramham					
Admission requirements Recommended previous knowledge: No prior knowledge or preliminary modules. Basic calculus and experience with matrices.					
Learning outcome, core skills The course will focus on the mathematical formulation of differential equations with applications to elastic theory and fluid mechanics. It gives an introduction to geometric linear algebra with emphasis on function spaces, coupled with the elementary aspects of partial differential equations. The students should learn to understand the mathematics side of the Finite Element Method (FEM) for elliptic PDE in low dimensions, appropriate Sobolev geometries, the FEM for Dirichlet and Neumann problems. For that reason, the basic principles in methods of error estimation are described to realize the understanding of fast and efficient solvers for the resulting matrix equations. As overall learning goal, the students should attain familiarity with modern methods and concepts for the numerical solution of complicated mathematical problems. After successfully completing the module, the students <ul style="list-style-type: none"> • should understand the mathematics side of the Finite Element Method for elliptic PDE in low • dimensions, appropriate Sobolev geometries, the FEM for Dirichlet and Neumann problems, should attain familiarity with modern methods and concepts for the numerical solution of complicated mathematical problems. 					
Contents a) Linear algebra: Basic concepts and techniques for finite- and infinite-dimensional function spaces stressing the role of linear differential operators. Numerical algorithms for solving linear systems. The mathematics of the finite element method in the context of elliptic partial differential equations (model problems) in dimension two.					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English					
Examination methods • Written exam 'Mathematical Aspects of Differential Equations and Numerical Mathematics' (120 min., Part of modul grade 100 %)					
Requirements for the award of credit points					

- Passed final module examination

Module applicability

- M.Sc. Subsurface Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Further Information

Remark: Due to the mixed background of the students, the exercise sessions often amount to additional lectures.

Mechanical Modeling of Materials					
Mechanical Modeling of Materials					
Module number CE-PO2/SE- CO-19/MMoM	Credits 6 CP	Workload 180 h	Semester[s] 1. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Mechanical Modelling of Materials			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr.-Ing. Daniel Balzani a) Prof. Dr.-Ing. Daniel Balzani					
Admission requirements Recommended previous knowledge: Basic knowledge in Mathematics and Mechanics (Statics, Dynamics and Strength of Materials)					
Learning outcome, core skills The objective of this course is to present advanced issues of mechanics and the continuum-based modelling of materials starting with basic rheological models. The concepts introduced will be applied to numerous classes of materials. Basic constitutive formulations will be discussed numerically. After successfully completing the module, the students <ul style="list-style-type: none"> • should have a deep understanding of the theoretical basis of classical material models, • should know how to derive constitutive equations from rheological models, • should be able to implement a material model with a suitable algorithmic treatment in finite element software. 					
Contents a) Several advanced issues of the mechanical behaviour of materials are addressed in this course. More precisely, the following topics will be covered: <ul style="list-style-type: none"> • Basic concepts of continuum mechanics (introduction) • Introduction to the rheology of materials • Theoretical concepts of constitutive modelling • Derivation of 1- and 3-dimensional models in the geometrically linearized setting for <ul style="list-style-type: none"> - Linear- and nonlinear elasticity - Damage - Visco-elasticity - Elasto-plasticity • Aspects of parameter identification/adjustment • Algorithmic implementation in the context of the finite element method and analysis of simple boundary and initial value problems 					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English					

Examination methods

- Written exam 'Mechanical Modeling of Materials' (90 min., Part of modul grade 100 %)

Requirements for the award of credit points

- Written exam 'Numerical Methods for Conservation Laws' (120 min., Part of modul grade 100 %)

Requirements for the award of credit points

- Passed final module examination

Module applicability

- M.Sc. Computational Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Numerical Simulation in Geotechnics and Tunneling					
Numerical Simulation in Geotechnics and Tunneling					
Module number BI-WP24/CE-WP09/SE-CO-3	Credits 6 CP	Workload 180 h	Semester[s] 2. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Numerical Simulation in Geotechnics and Tunneling			Contact hours a) 4 WLH (60 h)	Self-study a) 60 h	Frequency a) each summer
Module coordinator and lecturer(s) Prof. Dr.-Ing. Torsten Wichtmann a) Dr.-Ing. Christoph Schmüdderich					
Admission requirements					
Learning outcome, core skills After successfully completing the module, the students are able to <ul style="list-style-type: none"> • implement numerical models of complex boundary value problems in geotechnical engineering and tunneling, creating the adequate geometrical models, • evaluate numerical models and their results in a critical way, • acquire adequate knowledge in fundamentals of the finite element method to be able to adopt numerical simulation in design and control of geotechnical or tunneling problems with focus on the interactions between the soil and structures. 					
Contents a) The course deals with the numerical modeling of various geotechnical structures and tunnels: <ul style="list-style-type: none"> • Overall insight to the numerical simulation of geotechnical problems by using the finite element method and concise review of simple constitutive models • Introduction to Hardening Soil (HS) and Hardening Soil Small Strain (HSS) model and calibration of constitutive parameters of the HS and HSS model • Simulation of lab tests and optimization of constitutive parameters • Details for proper simulation in geotechnics by addressing constructional details, optimum discretization, boundary and initial conditions • Fundamentals of contact elements and their applications in geotechnical modeling • Considering water pressures in numerical simulations: soil-water interactions in drained, undrained, consolidation, and fully coupled hydromechanical analyses • Creation of models, execution of calculations and analysis of results for various geotechnical boundary value problems: shallow foundations, retaining walls, excavation, embankments, consolidation, slope failure, tunneling • Methods to validate and verify the reliability of numerical models by exploring the numerical outputs in space and time and the evaluation of numerical results • Introduction to FE simulations with Plaxis 2D and numgeo • Introduction to Finite Element Limit Analysis (FELA) and the FE software OptumG2 • Comparison of Plaxis2D, numgeo and OptumG2 for different boundary value problems • Brief overview of other numerical methods (e.g. DEM, MPM, boundary element method) 					

Educational form / Language

a) Lecture (4 WLH) / English

Examination methods

• Written exam 'Numerical Simulation in Geotechnics and Tunneling' (180 min., Part of modul grade 100 %)

Requirements for the award of credit points

- Passed final module examination

Object-oriented Modelling and Implementation of Structural Analysis Software					
Object-oriented Modelling and Implementation of Structural Analysis Software					
Module number CE-WP10/ OOFEM	Credits 3 CP	Workload 90 h	Semester[s] 2. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Object-oriented Modelling and Implementation of Structural Analysis Software			Contact hours a) 2 WLH (30 h)	Self-study a) 60 h	Frequency a) each summer
Module coordinator and lecturer(s) Prof. Dr. Roger A. Sauer a) Prof. Dr.-Ing. Matthias Baitsch, Assistants, Prof. Dr. techn. Günther Meschke					
Admission requirements Recommended previous knowledge: Finite Element Methods in Linear Structural Mechanics and Modern Programming Concepts in Engineering					
Learning outcome, core skills The seminar connects the theory of finite element methods (FEM) and object-oriented programming. After successfully completing the module, the students <ul style="list-style-type: none"> • can implement the theories and methods of the course 'Finite Element Methods in Linear Structural Mechanics' in an object-oriented finite element program and apply this program for the analysis of engineering structures, • have developed a program for the computation of spatial truss structures, • can verify the program using benchmark examples, • gained deep insight into the most relevant aspects for the implementation within the FEM and possibilities of using object-oriented programming for numerical approaches. 					
Contents a) The main topics of the course are: <ul style="list-style-type: none"> • short summary of the basics of FEM and project-oriented programming • preparing a project with two parts <ul style="list-style-type: none"> - Part 1: students individually develop and verify an object-oriented finite element program for the linear analysis of spatial truss structures - Part 2: students can choose between different options, either, the application developed in the Part 1 is extended to more challenging problems (nonlinear analysis, other element types, etc.) or students switch to an existing object-oriented finite element package (e.g. Kratos) and develop an extension of that software (e.g. material models, element formulations) 					
Educational form / Language a) Block seminar / English					
Examination methods • Term paper 'Project work and final student presentation' (<Ohne>, Part of modul grade 100 %)					
Requirements for the award of credit points					

Passed project work and final student presentation

Module applicability

- M.Sc. Computational Engineering
- M.Sc. Civil Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $3 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.

Quantum Computing					
Quantum Computing					
Module number CE-WP21/QC	Credits 6 CP	Workload 180 h	Semester[s] 3. Sem.	Duration 1 Semester[s]	Group size no limitation
Courses a) Quantum Computing			Contact hours a) 4 WLH (60 h)	Self-study a) 120 h	Frequency a) each winter
Module coordinator and lecturer(s) Prof. Dr. Andreas Vogel a) Prof. Dr. Andreas Vogel					
Admission requirements					
Learning outcome, core skills After successfully completing the module the students <ul style="list-style-type: none"> • are enabled to design and create programs for quantum computers • can critically evaluate quantum systems and quantum algorithms • can assess the benefit of using quantum effects in computations 					
Contents a) The lecture covers the theory and application of quantum computing from a computer science perspective with a focus on the usage of today's quantum hardware. The relevant basics of quantum mechanics including superposition, measurement, interference, entanglement and mathematical notation are introduced. The characteristics of quantum bits and registers are discussed, and the construction and properties of quantum gates and quantum circuits presented. Prominent examples for quantum algorithms are surveyed including algorithms based on quantum Fourier transformation (e.g. Shor's factoring), quantum search (e.g. Grover) and quantum solution of linear systems of equations (e.g. HHL). Current quantum computer hardware, including gate-based and adiabatic quantum computers, as well as quantum error correction are discussed. An introduction to quantum programming languages and environments will be provided. Hands-on programming exercises and self-implemented quantum circuits in study projects are used to discuss and illustrate the theoretical content. Implementations are tested on quantum simulators and cloudbased quantum hardware.					
Educational form / Language a) Tutorial (2 WLH) / Lecture (2 WLH) / English					
Examination methods • Exercises 'Quantum Computing' (80 h., Part of modul grade 100 %, Study project with oral examination)					
Requirements for the award of credit points <ul style="list-style-type: none"> • Passed final project and passed oral examination 					
Module applicability <ul style="list-style-type: none"> • M.Sc. Computational Engineering 					
Weight of the mark for the final score Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$					

FAK: The weighting factors can be taken from the table of contents.

Learning outcome, core skills After successfully completing the module, the students <ul style="list-style-type: none"> are able to employ at a minimum level all four skills (speaking, listening, reading and writing) in familiar universal contexts or shared knowledge situations such as greeting, small talk, shopping, making appointments, eating out, orientation, biography, healthcare etc. 					
Contents a) The learning goals of this German language course fulfill the special requirements of foreign students majoring in a subject that uses English as a teaching language. On a basic level, the main focus of the course lies on action-oriented speaking, listening, reading and writing comprehension so that the students learn to cope with everyday situations of their life in Germany. The classes consist of small groups, ensuring that students have ample opportunities to speak as well as having their individual needs attended to. All of our instructors are university graduates experienced in teaching DaF (Deutsch als Fremdsprache - German as a foreign language) and have been selected for their experience in working with students and their ability to make language learning an active and rewarding process. An optional intensive block course after the winter semester helps to activate and to intensify the newly acquired language skills.

Module coordinator and lecturer(s)					
Prof. Dr. Roger A. Sauer a) Dr.-Ing. Gerrit E. Neu b) Dr.-Ing. Ba Trung Cao					
Admission requirements					
Recommended previous knowledge: Fundamental knowledge in structural analysis, Finite Element Method, probability theory, and basic programming (MATLAB, Python)					
Learning outcome, core skills					
<p>The course equips students with theoretical foundations and practical skills to model, propagate, and mitigate uncertainties in structural analysis. Students will be able to define an uncertainty quantification problem, evaluate the effect of aleatory, epistemic as well as polymorphic uncertainty onto computational models and to interpret the results. It delves into surrogate modeling methods that approximate high-fidelity simulations, enabling efficient uncertainty assessment in complex systems. Applications to structural reliability, optimization, and risk-informed decision-making are emphasized, with hands-on experience using state-of-the-art computational tools.</p> <p>After successfully completing the modules, the students are able to</p> <ul style="list-style-type: none"> • Understand the role and significance of uncertainty in structural engineering and computational models. • Apply probabilistic and non-probabilistic methods for modeling uncertain parameters. • Develop and implement surrogate models for efficient uncertainty propagation and sensitivity analysis. • Use state-of-the-art tools and frameworks to solve real-world problems involving uncertain data. 					
Contents					
<p>a)</p> <p>The course deals with the uncertain data involving in structural analysis:</p> <ul style="list-style-type: none"> • Fundamentals of uncertainty quantification: types and sources of uncertainty (aleatory vs. epistemic) • Sources of uncertainty in structural engineering: material properties, geometry, boundary conditions, and external loads • Computing with uncertainty models: stochastic model, interval analysis, fuzzy logic, and polymorphic model • Evaluation of model responses due to uncertain inputs: Quantification by statistical measures, sensitivity analysis and structural reliability <p>b)</p>					

The course deals with the development of numerical surrogate models to accelerate the computation with uncertain data:

- Surrogate models based on black-box machine learning techniques (Artificial Neural Network)
- Surrogate models based on reduced order methods (Proper Orthogonal Decomposition)
- Surrogate models based on hybrid combination (Physics-informed machine learning)
- Comparison of surrogate modelling techniques: accuracy vs. computational efficiency

Educational form / Language

- a) Lecture (2 WLH) / English
- b) Lecture (2 WLH) / English

Examination methods

• Term paper 'Uncertainty Quantification in FE Analyses with Surrogate Modeling' (90 h., Part of modul grade 100 %, Final project assignment + presentation of the results is used to determine the final grade Deadline will be announced at the beginning of the semester.)

Requirements for the award of credit points

- Passed final module examination

Module applicability

- M.Sc. Civil Engineering
- M.Sc. Subsurface Engineering
- M.Sc. Computational Engineering

Weight of the mark for the final score

Percentage of total grade [%] = $6 * 100 * \text{FAK} / \text{DIV}$

FAK: The weighting factors can be taken from the table of contents.

DIV: The values can be taken from the table of contents.
